Description

The 74HC/HCT4053 is a triple single-pole double-throw analog switch ($3 \times$ SPDT) suitable for use in analog or digital 2:1 multiplexer/demultiplexer applications. Each switch features a digital select input (S_n), two independent inputs/outputs ($nY0$ and $nY1$) and a common input/output (nZ). A digital enable input ($\bar{E}$) is common to all switches. When $\bar{E}$ is HIGH, the switches are turned off. Inputs include clamp diodes. This enables the use of current limiting resistors to interface inputs to voltages in excess of V_{CC} .

Features:

- Wide analog input voltage range from -4.5V to +4.5V
- Wide supply voltage range
74HC4053: from 3V to 9V
- Low ON resistance:
 - 80 Ω (typical) at $V_{CC} - V_{EE} = 4.5$ V
 - 70 Ω (typical) at $V_{CC} - V_{EE} = 6.0$ V
 - 60 Ω (typical) at $V_{CC} - V_{EE} = 9.0$ V
- Typical “break before make” built-in
- Specified from -40°C to +125°C
- Packaging information: DIP16/SOP16

Applications:

- Analog multiplexing and demultiplexing
- Digital multiplexing and demultiplexing
- Signal gating

Note:

- [1] To avoid drawing V_{CC} current out of terminal nZ , when switch current flows into terminals nYn , the voltage drop across the bidirectional switch must not exceed 0.4V. If the switch current flows into terminal nZ , no V_{CC} current will flow out of terminals nYn , and in this case there is no limit for the voltage drop across the switch, but the voltages at nYn and nZ may not exceed V_{CC} or V_{EE} .
